References Category:Video game development softwareThe present invention relates generally to the field of laser systems, and more particularly to the field of remotely controlled laser systems for cooling, heating, protecting, and handling of workpieces and for providing a high power output. Remotely controlled laser systems are used in many commercial, industrial, and military applications, such as drilling, machining, welding, marking, water blasting, cutting, and other applications. For example, when used in welding, remote laser systems can create micro-dots on materials. Remote laser systems may also be used to liquefy gases to form a spray to cool a workpiece. A remote laser system can also be used to spray water or other liquids to cool a workpiece. When used to spray water, the laser provides sufficient energy to evaporate the water. The remotely controlled laser system can also be used to heat materials, to quickly dry materials, to bond materials, and to quickly bond large materials, such as airplane fuselage parts. Laser systems generate high power pulses which can damage electronic components, such as lasers, motors, and controls. To protect the electronic components, the electronic components are placed in a housing or a cooling shroud. The high power pulses, however, cause other components to heat up which can also be placed within the housing or shroud. Cooling components, such as water and air, are provided to cool components inside the housing or cooling shroud, and to cool components outside the housing or cooling shroud. In some applications, the cooling components may be directed at the electronic components to cool the components. A cooling shroud or housing is required to isolate the electronic components from the high power pulses and to protect the electronic components from damaging high power pulses. In addition, the cooling shroud or housing is required to protect the components from other high power pulses and to prevent components from overheating. The housing or cooling shroud generally encloses the electronic components within the housing or

cooling shroud. The enclosure is generally shaped to enclose the electronic components and to direct cooling components, such as water and air, to the electronic components. A remote control system controls the electronic components by providing a pulsed high power beam to the electronic components. The remotely controlled laser system is positioned to direct the beam towards the electronic components. The remotely controlled laser system may be mounted on a robotic arm or other device, or the remotely controlled laser system may be mounted to a stationary platform. The remotely controlled laser system also directs a cooling shroud or housing to protect the electronic
